

Hybrid AF™ Therapy Ablation for Long-Standing Persistent Atrial Fibrillation: a Case Study

AtriCure

Patient Presentation Example¹

A symptomatic 66-year-old African American male presents with long-standing persistent (LSP) atrial fibrillation (AF), duration > 4 years (ICD-10-CM² I48.2). His medical history is significant for failure to achieve control with Class I/III anti-arrhythmic drugs. He is currently on an oral anti-coagulant, as well as a beta blocker for hypertension and a statin for high cholesterol. The patient has failed one catheter ablation, and he is refractory to conservative medical management.

Current diagnostic workup shows the left atrium is < 6.0 cm. The electrophysiologist in consultation with the cardiac surgeon recommends a same-day hybrid ablation consisting of a surgical ablation (epicardial) followed by a radiofrequency (RF) catheter ablation (endocardial) to treat this patient's LSP AF.

The Epi-Sense[®] Guided Coagulation System with VisiTrax[®], used in the epicardial procedure, is intended for the treatment of symptomatic LSP AF that is refractory or intolerant to at least one Class I and/or III anti-arrhythmic drug. It is augmented with an endocardial RF catheter ablation procedure (2021 FDA PMA Approval).

Epicardial and Endocardial Hybrid Ablation Procedure: Provider Reimbursement³

A large percentage of patients with LSP AF who are eligible for surgery are over age 65, such as this case study patient. Commercial payer policies should also be considered; for example (but not limited to) leading medical policies listed in Table 1.

Table 1. Representative Commercial Plan Descriptors for the Hybrid Surgical Ablation Procedure for AF

Commercial Plan	Description of Hybrid Ablation in Policy
Anthem BCBS	Maze procedure for drug-resistant atrial fibrillation
BCBS Alabama	Hybrid Maze for stand-alone atrial fibrillation
Highmark BCBS DE, NY, PA, WV; BCBS ND	Hybrid catheter and surgical ablation for drug-resistant atrial fibrillation

The patient's epicardial-endovascular procedure for cardiac tissue ablation involves two distinct professionals who are rendering two distinct procedures. Commercial payment rates, which may be higher than CMS rates, and are dependent on specific payor contracts. Furthermore, other ancillary CPT codes (mapping, touchups, etc.) are not included, but they may be performed at the discretion of the provider.

Commonly reported International Classification of Diseases procedure codes (ICD-10 PCS) are shared for educational purposes only (Table 2).

Table 2. Representative ICD-10 PCS Codes⁴

ICD-10 PCS	Procedure	Description
02574ZZ	Minimally invasive surgical ablation (epicardial)	Destruction of left atrium, percutaneous endoscopic approach
02583ZZ	Catheter ablation (endocardial)	Destruction of conduction mechanism, percutaneous approach

The hospital's technical component—for the primary surgical procedure and the presence of any active co-morbidities—is dependent upon details in the patient's medical record. The patient's surgical discharge will likely be grouped to either MS-DRG 228 or 229 (Table 3).

Table 3. CMS Hospital MS-DRG Payment and Weight⁵

MS-DRG	Description	CMS National Average Base Payment 2022	CMS Low-Cost Geography Payment UAB (Birmingham, AL)	CMS High-Cost Geography Payment Maimonides (Brooklyn, NY)	Weight	Average MS-DRG Length of Stay Days
228	Other cardiothoracic procedures with Major Complications/Comorbidities (MCC)	\$35,150	\$37,417	\$61,757	5.3	9.6
229	Other cardiothoracic procedures without MCC	\$22,692	\$24,156	\$39,870	3.4	4.0

Ablation procedure codes are listed in Table 4, along with the Centers for Medicare and Medicaid Services (CMS) 2022 national average payments as well as payment rates from high-cost and low-cost geographies. For strategic planning purposes only, the Current Procedural Terminology (CPT®)⁶ surgical code may include CPT 33265 or CPT 33266; the code is left to the discretion of the surgeon when preauthorizing the patient for inpatient surgery.

Table 4. Representative CPT Codes for Professional Fees⁷

CPT	Description	CMS National Average Base Payment 2022	CMS Low-Cost Geography Payment UAB (Birmingham, AL)	CMS High-Cost Geography Payment Maimonides (Brooklyn, NY)	Work RVU	Total RVU
Cardiac Surgeon (1 surgical ablation code chosen)						
33265	Endoscopy, surgical; operative tissue ablation and reconstruction of atria, limited (e.g., modified Maze procedure), without cardiopulmonary bypass	\$1,384	\$1,328	\$1,824	23.7	40.0
33266	Endoscopy, surgical; operative tissue ablation and reconstruction of atria, extensive (e.g., Maze procedure), without cardiopulmonary bypass	\$1,870	\$1,796	\$2,466	33.0	54.0
Electrophysiologist						
93653 [^]	Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry	\$848	\$814	\$1,118	14.8	24.5
93656 [^]	Comprehensive electrophysiologic evaluation including transeptal catheterizations, insertion and repositioning of multiple electrode catheters with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation, including intracardiac electrophysiologic 3-dimensional mapping, intracardiac echocardiography including imaging supervision and interpretation, induction or attempted induction of an arrhythmia including left or right atrial pacing/recording, right ventricular pacing/recording, and His bundle recording, when performed	\$1,137	\$1,092	\$1,499	19.8	32.9
93613 [^]	Intracardiac EP 3-dimensional mapping	\$300	\$288	\$396	5.2	8.7
93621.26 [^]	With left atrial pacing and recording from coronary sinus or left atrium	\$96	\$92	\$126	1.5	2.8
93662.26 [^]	Intracardiac echocardiography during therapeutic/diagnostic intervention	\$92	\$88	\$121	1.4	2.7

[^]For 2022, certain Electrophysiology codes have bundled payments when billed together. If codes 93653, 93613 and 93621 are billed together, the payment is only at the 93653 rate. Similarly, if codes 93656, 93613 and 93662 are billed together, the payment is only at the 93656 rate.

Anticipated Patient Outcome

The patient's hybrid procedure in the current case study was completed in the facility's hybrid operating room (OR). The total OR time for the entire procedure was 195 minutes. Hospital stay was 3.2 days, including 1 day in the step-down unit. The patient was discharged in normal sinus rhythm and prescribed an oral anti-coagulant.⁸ After his post-surgical assessment by the cardiac surgeon, the patient resumed ongoing follow-up with his electrophysiologist.

Alternative Hybrid Ablation for AF Treatment Scenario

Occasionally, the cardiac surgeon and electrophysiologist will determine that it is in the patient's best interest to perform the procedure in a sequential format. The surgeon may determine that the heart needs time to remodel and edema needs time to subside before a catheter ablation can be scheduled with the electrophysiologist. As a result, the electrophysiologist would schedule the endovascular portion in the hospital's Cath Lab. The hospital's technical component for the primary procedure, CPT 93656, would be assigned to Ambulatory Payment Classification (APC) 5213: Level 3 EP Procedures, with Medicare's CY2022 National Average Payment of \$21,915.

Epi-Sense® System Instructions For Use: PMA# P200002

Epi-Sense® Guided Coagulation System

U.S. Indications: The Epi-Sense Guided Coagulation System is intended for the treatment of symptomatic long-standing persistent atrial fibrillation (continuous atrial fibrillation greater than 12 months duration) when augmented in a hybrid procedure with an endocardial catheter listed in the instructions for use, in patients (1) who are refractory or intolerant to at least one Class I and/or III antiarrhythmic drug (AAD); and (2) in whom the expected benefit from rhythm control outweighs the potential known risks associated with a hybrid procedure such as delayed post-procedure inflammatory pericardial effusions. **Contraindications** include patients with Barrett's Esophagitis, left atrial thrombus, a systemic infection, active endocarditis, or a localized infection at the surgical site at the time of surgery. **Adverse Events:** Reported adverse events associated with epicardial ablation procedure may include, but are not limited to, the following: pericardial effusion/cardiac tamponade, pericarditis, excessive bleeding, phrenic nerve injury, stroke/TIA/neurologic complication. Please review the Instructions for Use for a complete listing of contraindications, warnings, precautions and potential adverse events located at the following AtriCure web address: <https://www.AtriCure.com/Epi-Sense-Coagulation-Device>. **Warnings:** Physicians should consider post-operative anti-inflammatory medication to decrease the potential for post-operative pericarditis. and/or delayed post-procedure inflammatory pericardial effusions. Physicians should consider post-procedural imaging (i.e. 1-3 weeks post-procedure) for detection of post-procedure inflammatory pericardial effusions. **Precautions:** Precautionary measures should be taken prior to considering treatment of patients: (1) Deemed to be high risk and who may not tolerate a potential delayed post-procedure inflammatory pericardial effusion. (2) Who may not be compliant with needed follow-ups to identify potential safety risks. To ensure patients undergoing treatment with the Epi-Sense device are well informed, the benefits, potential risks and procedural outcomes associated with the Epi-Sense Hybrid Convergent procedure should be discussed with the patient. Physicians should document accordingly in the medical record. Qualified operators are physicians authorized by their institution to perform surgical sub-xyphoid pericardial access. The coagulation devices should be used by physicians trained in the techniques of minimally invasive endoscopic surgical procedures and in the specific approach to be used. Operators should undergo training on the use of Epi-Sense device before performing the procedure. Safety and effectiveness of concomitant left atrial appendage closure was not evaluated in the CONVERGE study. Follow-up should be conducted at approximately 30 days postprocedure to monitor for signs of delayed onset pericarditis or pericardial effusion. **Rx Only.**
